There now follow twelve (12) Figures of Pages numbered 19 to 40 inclusive.

**MAPS**

- **Figure #1 & 2** - Claim Location
- **Figure #3** - Claim Map
- **Figure #4** - D.D. Hole Location
1. INTRODUCTION

1.1 Holberg Mines Ltd. (N.P.L.) hold a number of claims near the head, and south, of Holberg Inlet, which is an extension of Quatsino Sound, in the north western area of Vancouver Island. They are in the Nanaimo Mining Division as defined by the Department of Mines and Petroleum Resources of the Government of the Province of British Columbia.

1.2 These claims include various deposits of high grade limestone, which outcrop on the property, and without overburden.

1.3 This Report gives the progress of exploration of these deposits to date, and refers to Claims known as FOX, JAY, HOL and NATIVE.

1.4 It should be noted that the twenty (20) Claims known as FOX 1 - 20 inclusive, whose Expiry Date is March 28th., was the subject of a claim for Assessment Work which was filed and accepted as at March 28th. 1975, under the Mineral Act, Section 51.
2. LOCATION, ACCESS and TOPOGRAPHY

2.1 The location of the claims is shown in the attached maps:

FIGURE 1 General location of the claims in relation to Vancouver, Victoria and Prince Rupert, British Columbia, and delineates the area shown in FIGURE 2.

2.2 FIGURE 2 The location of the claims, on a larger scale, in relation to Quatsino Sound, Holberg Inlet, Port Hardy, Port Alice, Suquash and Coal Harbour.

2.3 The approximate centre of the claims area lies at the intersection of the meridian of Longitude 127 degrees 56' West and of the parallel of Latitude 50 degrees 27' North. It will be noted that the claims are thus approximately three (3) miles east of the village of Holberg, and that they contact the south shore of Holberg Inlet.

The property location is to be found on National Topographic Reference Area 92L/12(w). Glerup Creek flows northwards from two small lakes lying within the claims area, and in the northern section of the area, there is Native Creek. A water supply for drilling purposes is thus fairly close at hand. Pettagem Creek lies to the south of the area. FIGURE 3.

2.4 The property may be reached by 32 miles of logging road from Port Hardy, and logging roads have been constructed
on a liberal scale across the area.

Port Hardy has an airport which is served by Pacific Western Airlines, with connections to Vancouver. An amphibian aircraft charter is available at Port Hardy for air travel to Holberg.

2.5 The proximity of the shoreline of Holberg Inlet will be found advantageous in that deep-draught ships can be accommodated almost adjacent to the plant for limestone processing.

Almost all of the claims area has been logged.

2.6 Elevations on the property range from sea level on the northern boundary to over 1,300 feet on the eastern boundary. There are two other high points, of over 1,100 feet. Mount Hansen, 1,993 feet high, lies to the west of the area, and overlooks the village of Holberg. There are two main ridges of hills whose axes are parallel to Holberg Inlet. The northernmost ridge has steep sides, whilst the southerly ridge has more gentle slopes. Glerup Creek lies between these two ridges.
3. TITLE TO THE CLAIMS

3.1 A total of fifty (50) Claims are concerned in this Report. All these claims are in good standing as of the date of this Report, and the work performed in recent months brings all the claims into good standing for a further period of one (1) year.

Names, record numbers and Expiry Dates of these claims, after the value of work recently performed has been applied are as follows:

<table>

</table>

FIGURE 3 shows the relative positions of these claims.

3.2 The site of the limestone deposit on these claims lies within an existing timber forest licence held by Rayonier Canada Limited. Because of this, the limestone cannot be staked under the Land Act or the Mineral Act.
3.3 All the claims have a Free-Use Permit from the British Columbia Department of Lands, Forests and Water Resources, valid until August 5th, 1976. This allows timber to be cut in order to clear up to 20 drill sites, which must be located within 66 feet of existing logging roads crossing the claims area.

3.4 By letter dated August 16th, 1974, written by the British Columbia Forest Service to the Company's solicitors, it was confirmed that it is not a Departmental policy to accept an application for limestone over mineral claims from other than the owner of those claims.

3.5 It was further confirmed in that letter of August 16th, 1974 that an application for limestone from another party would constitute a conflict of interest since the Department takes the position that limestone and minerals may be inseparable.

3.6 Because of the foregoing, the Company and its solicitors believe that the Company is protected should it expend funds in the development of the property.
4. GEOLOGY

4.1 This is described in a publication of the Geological Survey of Canada, Paper 74-8, entitled "Geology and Mineral Deposits of Alert Bay - Cape Scott Map Area, Vancouver Island B.C.", by Muller J.E., Northcote K.E., and Carlisle, D., 1974.

The map accompanying this Memoir indicates that the claims cover an area of the Quatsino Formation, which consists of limestones. To the south and east there are areas designated as Parson Bay Formation, which consists of sedimentary rocks such as siltstones, limestones, greywacke, conglomerates and breccias, whilst to the north of the Quatsino deposits, and bordering Holberg Inlet, there are basaltic lavas, pillow lavas, breccias and aquagene tuffs of the Karmutsen Formation.

4.2 The older of these formations is the Karmutsen, which underlies the Quatsino and the younger Parson Bay Formations apparently conformably. All three formations are attributed to the Upper Triassic System. The Parson Bay formation was formerly known as the Bonanza Formation. Major faulting defines the boundaries of these formations on the east and west sides of the Quatsino.

4.3 The limestone of the Quatsino Formation is described in general as being "coarse bioclastic, light grey and massive", and about 950 feet thick, plus or minus 100 feet. Thin sections of the limestone show grains of recrystallised calcite 0.01 mm to 0.02mm in size. The generally low dolomite and silicate
content is shown by analysis of samples taken by McCammon (1969) in the Alert Bay-Cape Scott Map Area, which show an average of only 1.15% MgO and 1.17% insolubles. These figures compare favourably with those from analyses made of samples of limestone from the claims area, given later in this Report.

4.4 The geology of the Coal Harbour-Port Hardy area has also been partially described in the British Columbia Mines Minister's Report for 1968, Page 85.

4.5 A geological report concerning 300 claims of Holberg Mines Ltd., lying in the general area of Holberg Inlet including the 60 claims herein referred to, was written by David R. Morgan, P.Eng. in March 1970, following his investigations in the field. He refers to the limestones of the local area, as it is the host rock for the mineralisation with which he was concerned at that time. He describes it on Page 16 of his report, and we quote, in part:

"Limestone: Apparently great thicknesses of limestone occur in the central part of the area mapped. These are the three main types:

(a) Grey Limestone: Grey weathering, pale grey to buff grey and asphanitic on the fresh surface, usually with a conchoidal splintery fracture. This limestone is almost lithographic in its asphanitic purity. Great thicknesses occur in the southwestern part of the carbonate belt.

(b) Dolimitic Limestone: This rock is typically buff weathering, pale buff grey and aphanitic on the fresh surface. It too has splintery conchoidal fracture.

(c) Dark Grey Limestone: Dark grey to black on the weathered and fresh surface due to argillaceous or carbonaceous inclusions. Occasional fossiliferous, it appears in the northern part of the carbonate belt .......... and is probably close to the bottom of the Quatsino."

5. DIAMOND DRILLING PERFORMED TO DATE.

5.1 In February and March 1974, diamond drillholes (size XRP), named 74A-1, 74A-2, 74A-3, 74A-4 and 74A-5 were drilled at locations shown in FIGURE 4.

5.2 An analysis of grab samples of the limestone was made on April 9th, 1973 by General Testing Laboratories of Vancouver, and this is reproduced in FIGURE 5.

It will be noted that the magnesia (MgO) is 1.19% and that the calcium carbonate (CaCO$_3$), by calculation is 97.32%. The iron content is 0.14%. The limestone represented in this sample is thus of a high grade.

5.3 The logs of these holes are shown in FIGURE 6, and sections of strata passed through are depicted in FIGURE 7.

These expose the presence of whitish, grey and dark grey-brown limestones and limey dolomites, some of which have been marbelised in places. Volcanic intrusions have also been found amongst the sedimentary beds.

5.4 Up to the present time, no holes have been drilled in the two limestone deposits to the south east and information on these is confined to surface outcrop observations.

5.5 In August, 1975, diamond drillholes (size XRP), named 75-1, 75-2, 75-3, 75-4 and 75-5 were drilled at locations shown in Figure 4.
5.6 The "75" Series drill hole logs are shown in FIGURE 8.

5.7 The drill cores were forwarded on September 26th, 1975 to Montreal for complete analysis. The information thus derived will not be available until the beginning of December 1975, when it will be communicated to those concerned.

5.8 A complete analysis of all of the drill cores is necessary as it forms the basic information for the design of proposed processes of which the limestone is the feedstock.

Before the cores were sent from Vancouver, Mr. Peter Eastwood was contacted, and it was agreed that since the cores showed, in the main, only limestone (of various colours such as white, creamy white, grey and dark grey), and that the log of each drill core had been noted, further inspection by his Department would not be necessary.

5.9 The drilling contract for the "75" series of drill holes was a verbal one. The President of Holberg Mines Ltd. arranged with N. Dootoff Drilling to drill the holes, at a price of $6.00 per foot of drilling, an additional $6.00 per foot for any casing required, a rental for the drill and ancillary equipment of $25.00 per diem, together with all related expenses of board and lodging, drilling supplies and freight. Water supply by
pump and piping created a problem which was solved, by agreement between the parties, by hiring a local labourer-assistant with a truck to transport water in barrels from Holberg village to the drill sites.
6. STATEMENT OF EXPENDITURES ON CLAIMS

6.1 This Statement, on the pages following this one, covers the work performed between August 12th, 1975 and October 10th, 1975. The work consists of drilling the five (5) diamond drill holes of the "75" Series, logging the cores and geological reconnaissance activity connected with the claims.

6.2 For the purpose of allocating the expenditures between "Drilling" and "Geological, Geochemical and Geophysical", a breakdown of the expenditures is attached, also an allocation of expenditures as to the separation of the claims into two Groups named "A" and "B" is included. The last grouping of these claims took place three (3) years ago.

6.3 Included in this Report are the copy of the Form giving "Notice to Group" for each Group (FIGURES 9 and 10), and the copy of the Affidavit Form for each Group (FIGURES 11 and 12) to record the work performed and its value for Assessment of the Claims for the ensuing year.
7. QUANTITY OF LIMESTONE

7.1 Our previous Report, dated March 27th, 1975, assumed an approximate area of limestone available of 190.3 hectares (470 acres). At that time, we were justified in assuming, only, a workable thickness of limestone of 21.336 metres (70 feet), based on the information gained from the "74A" Series of drill holes.

7.2 The "75" Series of drill holes have revealed 45.72 metres (150 feet), at least, of clean limestone without overburden. Assuming the limestone weighs 2,722kg per cubic metre (170 lbs. per cubic foot) there are some 260 million short tons of limestone "in place" down to this depth.

7.3 In other words, more than sufficient reserves of limestone are thus indicated to be present for the purposes intended by Holberg Mines Ltd. for many years to come, and in any event far in excess of that tonnage required to satisfy any feasibility consideration for processing plants or external direct sales of limestone from this site.
8. CERTIFICATION

8.1 This Report has been compiled and written by

HUBERT S. HASLAM

Consulting Mining Engineer and President of H.S. Haslam and Associates Limited, following a visit to the claims area of Holberg Mines Ltd. (N.P.L), consultations with the President of this Company and examination of Company and other reports upon the area in question and surrounding areas.

8.2 I hereby certify that:

(a) I hold the degree of Bachelor of Engineering in Mining, First Class, also the degree of Master of Engineering in the University of Sheffield.

(b) I hold, through examination, Fellowships in

The Institution of Mining Engineers
The Institution of Mechanical Engineers
The Institution of Civil Engineers

(c) I am a Registered Member of the Association of Professional Engineers of British Columbia, also of the Consulting Engineers Division of that body, in addition to similar registration in the Provinces of Alberta, Ontario and Quebec.

(d) I am a Member of

The Canadian Institute of Mining and Metallurgy
The Engineering Institute of Canada
The American Institute of Mining and Metallurgical Engineers

H. S. HASLAM AND ASSOCIATES LIMITED
8.3 I hereby certify that I am
a practising consulting Mining Engineer and
reside at 2144 Nelson Avenue, West Vancouver B.C.

8.4 I hereby certify that
I have no direct or indirect interest whatsoever
in Holberg Mines Ltd. (N.P.L.) nor in the mineral
claims mentioned in this Report, nor do I expect
to receive any interest, direct or indirect, in
the properties of Holberg Mines Ltd. (N.P.L.) or
any affiliate or any security of the company or
affiliate.

Dated at West Vancouver, B.C., this 10th day of October, 1975

H.S. Haslam, P.Eng.
President,
H.S. Haslam and Associates Ltd.
